# Wisconsin Small-Area Baseline Population Projections

Wisconsin State Data Center Series 80–1
March 1986

The Wisconsin State Data Center (WSDC) is part of a cooperative program of nationwide state data centers created by the U.S. Bureau of the Census in the 1970s to respond to the needs of local data users. Two coordinating agencies and 38 affiliate organizations - primarily libraries and regional planning commissions - comprise the Wisconsin State Data Center. The two coordinating agencies are the Demographic Services Center in the Wisconsin Department of Administration, and the Applied Population Laboratory in the Department of Rural Sociology, University of Wisconsin-Madison/Extension.

The Wisconsin State Data Center conducts applied demographic research and analysis, responds to client questions and requests, provides consultation, conducts conferences and workshops, and produces and distributes a wide range of demographic publications.

## ACKNOWLEDGEMENTS

This report represents the culmination of a project that spanned almost three years of research and evaluation. During that time many individuals, representing several different state agencies, were involved in one way or another with the project and their participation and patience is acknowledged with much appreciation.

The need for a consistent set of statewide small-area population projections was first raised by Randall Wade, then with the Water Quality Planning Section of the Department of Natural Resources. Other DNR personnel subsequently involved in the project include Sharon Meier and Lynn Persson. Don Holl, then head of DOA's Demographic Services Center, brought together representatives of several state agencies in late summer 1983 to lay out a strategy both for eventually funding the effort and for carrying out the appropriate statistical tests on various projection models before undertaking the actual projection work. Along with the authors, those persons taking part in these early meetings were Don Holl (DOA), Randall Wade and Sharon Meier (DNR), Don Revello (DOT), Jim Johnson (DATCP), Henry Krebs (DHSS), Roger Nacker (DOD), and Jerry Snow and Joe Tumpach (DILHR). Special thanks are due to Nadene Roenspies who, as Don Holl's sucessor at the Demographic Services Center, was faced with the task of bringing the project to a close and soliciting local response to the preliminary release of the projections. Several individuals, including regional planning commission staff members, Cooperative Extension Service county CRD agents, and local officials, kindly took the time to respond and comment on the preliminary numbers. This assistance, late in the production process was helpful and informative.

In 1983, the demographic literature addressing subcounty population projecting was very limited. As a consequence, this project developed new techniques and approaches to small-area projecting which now are being considered and/or used by others facing similar tasks. The success of this developmental work would not have occurred without the counsel and close participation of our colleagues Henry Krebs of the Center for Health Statistics, Department of Health and Social Services, and Charlie Palit, of the Wisconsin Survey Research Laboratory, University of Wisconsin-Madison.

Janet Anderson was the person who handled the large programming and data management effort. She has our praise for coping well under the very frequent calls for changes and the introduction of yet further tests along the way.

To all these persons we extend our sincere thanks, acknowledging that the errors in these projections, which most surely will emerge as the future unfolds, are solely the result of the authors' cloudy crystal ball.

## INTRODUCTION

The municipal population projections presented here were developed by the Demographic Services Center of the Wisconsin Department of Administration, and the Applied Population Laboratory of the Department of Rural Sociology, University of Wisconsin-Madison, in cooperation with a consortium of state agencies. This project was initiated by the State Department of Natural Resources and was supported by the Departments of Agriculture; Development; Health and Social Services; Industry, Labor and Human Relations; and Transportation. Appendix A contains a note on the methodology employed in producing the projections.

These projections are based on past and current trends, and are intended as a base-line guide to users in the absence of forecasts that incorporate additional information such as land usage, zoning regulations, planned and proposed developments. Preferred series of forecasts of this latter type are available for different areas in the following counties of the state: Dane, Fond du Lac, Kenosha, Milwaukee, Outagamie, Ozaukee, Portage, Racine, Walworth, Washington, Waukesha, Winnebago and Wood. These alternative scenarios have been developed by regional and local planning agencies and can be found in Appendix B. It should be noted that the forecasts developed by planning agencies sometimes cover groups of municipalities. If, in such cases, forecasts for individual cities, villages, or towns are desired, users should contact the appropriate planning agency or the Demographic Services Center for assistance in deriving the desired numbers.

As the future cannot be predicted with certainty, a few words of caution to the users of the projections are in order. First, the smaller the community, the wider is the error margin. Consequently, one should work with municipality groups rather than individual municipalities as far as possible. Similarly, the longer the time horizon, the greater is the error. It is, therefore, advisable to use a 5 to 10-year projection instead of a 25-year projection, if possible. Lastly, as time passes, new information becomes available. For example, the Demographic Services Center produces population estimates for all cities, villages, and towns in Wisconsin on an annual basis. It would be worthwhile to see if the projected trend is consistent with the trend shown by the new estimates. In so doing, one should look at the time series of the annual estimates rather than an estimate for a particular year. In short, users are urged to be cautious when they incorporate the population projections into their work.

Appendix C gives the addresses of Wisconsin regional planning agencies. Users should contact the appropriate regional planning commission or the Demographic Services Center when a specific local program or plan involving state government support is under consideration. Call (608) 266-1624 for Demographic Services Center assistance with projections.

## APPENDIX A

## Methodology

### Some General Considerations

The methodology to project the populations of Wisconsin's minor civil divisions (municipalities) was developed within the framework of a series of general guidelines. The guidelines were first drawn from the forecasting literature, both demographic and nondemographic, and final decisions were developed in the testing and evaluation process. The resulting main principles governing the projection methodology are summarized below:

First, long term population projections, particularly for small areas, require consideration of historical data series of approximately equal length. While a five-year population projection may require little information beyond a solid benchmark and some sense of trends in the recent past, a thirty-year projection should be informed by recent as well as earlier data.

Second, once the historical data are assembled, more recent data should have greater influence in the projection process. The assumption here is that while both more distant as well as recent historical data speak to the future, the data from more recent periods speak with greater force. This approach has both strong intuitive appeal and empirical support. In the projections presented here, homogeneous weights approximating 1/6, 1/3, and 1/2, respectively, are generally used for the three decades of historical data, 1950-60, 1960-70, and 1970-80.

Third, many projections averaged together are likely to produce better results, overall, than is a set of Minor Civil Division (MCD) projections based only on a single model. Averaging permits unusually high and low projections to balance one another; it has long been a preferred procedure for both population estimates and projections.

Fourth, since county projections generally are produced using more developed methodologies than are available for MCD projections, the latter should be adjusted to incorporate the projected trends for the county unit. The cohort component technique, which permits the projection of age-specific rates for the separate components of population change and takes into account the changing age-structure of the population, is the most frequently used method for producing county-level projections. Since such projections more fully exploit a wider range of information, they are believed to give a population size of greater confidence than does the sum of the sub-area projections based on much simpler techniques or more limited data series. Nevertheless, an MCD projection based on its own population trend does contain its unique, dynamic nature and this "place effect" should not be completely diluted. MCD projections containing both the "county effect" and the "place effect" should yield the best results.

Fifth, almost all extrapolation models are inherently risky. They assume continuation of trends or patterns that, for all practical purposes, may not be sustained for long. Clearly, rates of change that are too rapid have to be adjusted so as to dilute at least some of their undesirable traits and thereby also improve their performance.

Sixth, population of individual cities, villages, and towns may be affected not only by births, deaths, and migration, but also by area changes which are often less amenable to extrapolation than are the purely demographic factors. Thus, at least initially, two or more MCDs should be treated as an "MCD cluster" for projection purposes whenever they are affected by boundary changes owing to new incorporations, disincorporations, and territorial annexations containing sizeable populations. The MCDs which are combined and projected as a cluster may be disaggregated later using proportions of the total in more recent years so as to preserve the recent "demographic momentum" of the individual MCDs while disregarding any apparent "annexation momentum" in the historical data.

Finally, techniques that reasonably capture and extrapolate the momentum of historical population trends will essentially produce baseline projections. Local geophysical conditions, environmental concerns, current comprehensive land use plans, existing zoning restrictions, taxation, and other policies influence business and residential location. These and other similar factors that can govern the course of local development and have a profound effect on future population change were not taken into consideration in the development of these projections. The present projections represent the momentum of population change in an area in the absence of physical constraints or political restrictions. To the extent that such constraints or restrictions are known to exist, these projections need to be modified or tempered before they can be incorporated into planning documents or facility construction proposals. Subjective impressions and expectations alone may not suffice to quantify the modifications to be introduced. Only data and information which provide an objective basis for the potential changes are likely to enhance the credibility of any alternatives.

## Selected Methodology

In 1983 and early 1984, a group of demographers from State government and the University of Wisconsin-Madison searched the demographic literature for models that had been used by others in an attempt to extrapolate population trends. Several models located were used in test applications. Thirty-year projections were made using a 1970 time origin. Of particular interest, beyond the general "behavior" of the models, was each model's ability to accurately forecast the 1980 population of the 128 MCDs in the four test counties.

On the basis of this test work, 11 extrapolation models were selected for the projection of the 1980-based projections. The test results confirmed that averaging several individual projections yields a lower overall error than if the results of even the best models are used alone.

The information provided here is insufficient in detail to enable anyone to replicate precisely the procedures carried out in each step of the projection process. A more detailed methodological statement is in preparation and will be available soon.

The 11 models selected can be grouped under five broad methodological strategies. Three methods, comprising a total of six models, used only data input from decennial counts of 1950 through 1980. Two methods, with a total of five models, used decennial counts and intercensal estimates for the years 1960 through 1980. The method/model/data combinations are as follows:

| Model No. | Method | Model Variety | Data Input |
|---|---|---|---|
| 1. | Arithmetic Extrapolation | Weighted average increment of change over past 3 decades | Decennial census counts 1950-80 |
| 2. | Growth Rate | Growth rate for 1970-80 decade | Census counts 1970 & 1980 |
| 3. | Growth Rate | Weighted average growth rate over past 3 decades | Same as Model 1 |
| 4. | Ratio Share | Constant share | Share of county in 1980 |
| 5. | Ratio Share | Trended share; weighted average trend over past 3 decades | Same as Model 1 |
| 6. | Ratio Share | Same as Model 5 but with 1980 share averaged in to moderate trend | Same as Model 1 |
| 7. | Regression | Simple linear regression of observed data against time | Decennial census counts 1960-80 and annual inter-censal estimates |
| 8. | Regression | Quadratic regression of observed data against time | Same as Model 7 |
| 9. | Time-Series | Second-order autoregression with a constant | Same as Model 7 |
| 10. | Time-Series | Second-order autoregression without a constant | Same as Model 7 |
| 11. | Time-Series | Box-Jenkins ARIMA (1,1,0) with a constant | Same as Model 7 |

Modifications For Abnormal Rates of Change

A. Adjustments to Models 1-6: In most procedures that incorporate decennial inputs, the customary extrapolation techniques were supplemented by a two-step adjustment scheme designed to dampen unusually high rates of growth or decline. The test against the 1980 counts shows that these adjustments dilute some of the least desirable characteristics of extrapolation models and improve their overall performance.

Step No. 1. Once the usual element to be projected forward was determined for Models 1, 2, and 3 (e.g., once the weighted average annual increment of population change to be projected forward in the arithmetic extrapolation model had been determined), an implied annual rate of population change at the point of the forecast time origin was calculated for each MCD in the county. The mean and standard deviations of these MCD rates of change also were determined. Any MCD rate that fell outside the range

$$\text{mean} \pm 1.5(\text{S.D.})$$

was arbitrarily reset so as to equal the nearest of

$$\text{mean} + 1.5(\text{S.D.}) \qquad \text{or} \qquad \text{mean} - 1.5(\text{S.D.}).$$

The purpose of this adjustment was to dampen the rate-of-change outliers by taking into consideration for each MCD the average rate (and variation about that average rate) of population change in neighboring MCDs. The adjustment assumes that unusually high rates of growth or decline for any given MCD cannot continue for very long into the future and should therefore be dampened so as also to reflect the behavior of other nearby MCDs.

It was not necessary to incorporate the above adjustment into Model 4 projections since the constant distribution model attributes future county population according to a set schedule of shares. In Models 5 and 6, however, similar adjustment procedures were applied to the trended shares. That is, outliers in the implied rate-of-change-of-share distribution were softened based on the average, and variation on either side of the average, of the changing shares of all MCDs in the county.

Step No. 2. Even after extreme rates of population decline (or extreme rates of declining shares) had been softened by the procedures in the first step, it remained possible for the extrapolations to eventually yield negative numbers (or negative shares). (The growth rate procedure of Models 2 and 3, by their nature, do not permit this occurrence.) To prevent a negative number yield, a trial 80-year-ahead projection was made for each declining MCD. If the slope of the decline was such that the implied MCD population (or share) remained positive, then no further adjustment was made. If, however, the implied population (or share) became negative within an 80 year horizon, the trajectory of decline arbitrarily was modified or softened so that the MCD population size (or share) equalled zero at exactly the 80-year point -- thereby preventing the population from approaching zero within the shorter 30-year horizon of the projections.

B. Adjustments to Models 7 through 11: For the projection models that use the annual MCD estimate series, similar adjustments were made.

Step No. 1. Models 8 through 11 have the potential of permitting a population projection to "take off" on an explosive (implosive) trajectory. A take off control strategy was adopted to avoid the problem. The implied rate of change over the first five years of the horizon was first determined. Then a procedure analagous to Step 1, above, was carried out to pull in outliers in the rate of change distribution of the MCDs. Annual increments of change derived from these rates of change were then extrapolated to yield the remaining population projections. In other words, the quadratic regression and time-series models were used to set the future population course over the early years (i.e., the first five years) of the horizon only. At that point, a linear extrapolation took over.

Step No. 2. Following Step 1 to soften any explosive rates of change, a second step, as described above, was applied to prevent the occurrence of implied future populations of less than zero.

## Adjustment to DOA County Projections

The sums of the MCD projections do not necessarily agree exactly with the most recent (1983) set of county population projections prepared by the Department of Administration. This occurrence is not the result of an oversight. It was learned in the test phase that about half the time, the historical momentum of the MCD populations yields a superior total than does the same set of MCD projections constrained to an independently projected county total. A weighted average of the unconstrained and constrained MCD projections provided better results. In projections presented here, the following weights were used:

| | Constrained Projections | Unconstrained Projections |
|---|---|---|
| 1985 | .5 | .5 |
| 1990 | .6 | .4 |
| 1995 | .7 | .3 |
| 2000 | .7 | .3 |
| 2005 | .7 | .3 |
| 2010 | .7 | .3 |

This differential weighting permits the "place effect" to have equal weight with the "county effect" in the near term horizon. In the long run, however, the constrained projections (the "county effect") are given a greater weight. Long-term county projections, produced by the Wisconsin Department of Administration, incorporate two important elements. First, they are controlled by an independently derived state-wide projection likely to contain a relatively smaller margin of error. Second, the migration rates of individual counties are moderated over the projection period. It is highly improbable that any area can continue to experience fixed high rates of in- or out-migration indefinitely. The county projections are judged to show a more reasonable long term trend and are therefore given a greater weight when the projection horizon extends beyond the immediate future. Note, however, that while the "place effect" is diminished, it is not eliminated even in the long run. As a consequence, the sum of the MCDs will not be the same as the DOA county projections.

## Adjustment for Post-1980 Trends

The projections, after incorporating all of the above adjustments, still are 1980-based. They are uninformed by the population estimates for 1981 through 1984. Using the annual estimates (including the MCD estimate series dating from 1960), the Department of Administration produced a single-year 1985 forecast for the Department of Revenue. As one final adjustment, the 1985 forecasts were used to modify the near-term horizon of the MCD projections.

For the year 1985, the long range projection was averaged with the year-ahead forecast recently produced by the DOA. This had the effect of bringing the projection trajectory into modest agreement with the most recent data. The ratio of the new 1985 projection to the original 1985 projection was then calculated. The result was subtracted from 1 to determine the relative extent by which the new projection departed from the original. Half the difference was added to the observed ratio in 1985 and applied to the 1990 projection and three-fourths of the difference was used to modify the 1995 projection. By the year 2000, the effect of the adjustment for recent population trends was reduced to zero.

## Detailed Review and Adjustment

Results of the above procedure were reviewed in detail, MCD by MCD. Four questions provided the framework for this review:

First, how does the county total of municipality projections compare with the DOA's independently derived county projections for the year 2010? Was the difference more than 5 percent? A large percent difference in itself did not mean that results for every MCD in the county appeared out of line, but only that those for some might be.

Second, does the 1985 projection show a different trend in direction and level than the 1985 one year ahead forecast which incorporated estimates for recent years? A difference of 25 or more (for MCDs under 250 persons) to 500 or more (for MCDs over 50,000 residents) was noted.

Third, was the long term trajectory steep in the light of the MCD's immediate post-1980 trend? A special note was made of a fast growth in an incorporated place.

Fourth, did the long term projection show over the projection horizon a significant change in direction which was at variance with its history?

In over 80 percent of the MCDs, the projections stayed within the review guidelines. The remaining MCDs exhibiting projection problems belonged to three categories:

A. MCDs that experienced an abnormal growth in the 1970s

B. MCDs which were treated as part of a cluster and were influenced by the larger members within the cluster, and

C. MCDs which were experiencing moderate growth in population but were significantly pulled down by the county normalization component.

A final modification was introduced in the projections of MCDs whose projections appeared unreasonable in the review process. Average numerical growth for a 5-year period was derived from the population change witnessed during the 1960s, 70s, and 80s. The 1985 one-year-ahead forecast based on annual estimates (including those for the post-1980 period) was used as an indication of the trend in the 1980s. This adjustment has smoothed unusual trajectories and made the projections more reasonable within the baseline context.

## APPENDIX B

### Planning Agency Forecasts For Some Planning Areas

| County | | Area | Population 1980 | 1990 | 2000 | 2010 |
|---|---|---|---|---|---|---|
| Dane | 1. | Village of Belleville (Dane Co. pt.) and Town of Montrose - pt. | 1,215 | 1,376 | 1,508 | 1,688 |
| | 2. | Village of Black Earth and Town of Black Earth - pt. | 1,179 | 1,232 | 1,294 | 1,389 |
| | 3. | Village of Blue Mounds and Town of Blue Mounds - pt. | 390 | 451 | 498 | 551 |
| | 4. | Village of Brooklyn (Dane Co. pt.) | 250 | 267 | 290 | 321 |
| | 5. | Village of Cambridge (Dane Co. pt.) and Town of Christiana - pt. | 791 | 840 | 895 | 971 |
| | 6. | Village of Cottage Grove and Town of Cottage Grove - pt. | 901 | 1,132 | 1,315 | 1,549 |
| | 7. | Village of Cross Plains, Town of Cross Plains - pt., and Town of Berry - pt. | 2,175 | 2,750 | 3,324 | 4,030 |
| | 8. | Village of Dane | 518 | 546 | 584 | 636 |
| | 9. | Village of Deerfield and Town of Deerfield - pt. | 1,497 | 1,730 | 1,947 | 2,234 |
| | 10. | Village of Deforest, Town of Windsor - pt., and Town of Vienna - pt. | 3,659 | 4,735 | 5,673 | 6,843 |
| | 11. | Town of Dunn and Town of Pleasant Springs - pt. | 1,956 | 1,958 | 1,959 | 1,960 |
| | 12. | Town of Albion - pt. | 508 | 516 | 536 | 570 |
| | 13. | Village of Marshall and Town of Medina - pt. | 2,366 | 3,241 | 3,775 | 4,336 |
| | 14. | Village of Mazomanie and Town of Mazomanie - pt. | 1,333 | 1,360 | 1,408 | 1,504 |
| | 15. | Town of Windsor - pt. | 319 | 329 | 344 | 370 |
| | 16. | Village of Mount Horeb, Town of Blue Mounds - pt., and Town of Springdale - pt. | 3,301 | 3,722 | 4,101 | 4,534 |

| County | | Area | Population 1980 | 1990 | 2000 | 2010 |
|---|---|---|---|---|---|---|
| | 17. | Village of Oregon, Town of Oregon - pt., and Town of Rutland - pt. | 3,927 | 4,725 | 5,445 | 6,213 |
| | 18. | Village of Rockdale, and Town of Christiana - pt. | 209 | 219 | 230 | 248 |
| | 19. | Town of Roxbury - pt. | 217 | 230 | 246 | 269 |
| | 20. | City of Stoughton, Town of Pleasant Springs - pt., and Town of Dunkirk - pt. | 8,256 | 8,901 | 9,631 | 10,389 |
| | 21. | City of Sun Prairie, Town of Bristol - pt., Town of Windsor - pt., Town of Burke - pt., and Town of Sun Prairie - pt. | 13,306 | 17,680 | 20,451 | 23,201 |

## APPENDIX C

### Wisconsin Regional/County Planning Commissions

Ralph Bergman, Executive Director
Bay-Lake Regional Planning Commission
Socio-Ecology Bldg., Suite 450
University of Wisconsin
Green Bay, WI 54301-7001
(414) 465-2135/2143
Serves Door, Florence, Kewaunee, Manitowoc, Marinette, Oconto, and Sheboygan Counties

B.F. Paruleski, Exec. Director
Brown County Planning Commission
100 North Jefferson Street
Green Bay, WI 54301
(414) 436-3633
Serves Brown County

Charles Montemayor, Director
Dane Co. Regional Planning Commission
City-County Bldg., Room 523
210 Monona Avenue
Madison, WI 53709
(608) 266-4137
Serves Dane County

Roy C. Willey, Jr., Exec. Director
East Central Wisconsin Regional Planning Commission
140 North Main Street
Menasha, WI 54952
(414) 729-1100
Serves Calumet, Fond du Lac, Green Lake, Marquette, Menominee, Outagamie, Shawano, Waupaca, Waushara, and Winnebago Counties

Greg Flogstad, Director
Mississippi River Regional Planning Commission
400 North 4th Street, Room 110
La Crosse, WI 54601-3227
(608) 785-9396
Serves Buffalo, Crawford, Jackson, Monroe, La Crosse, Pepin, Pierce, Trempealeau, and Vernon Counties

Arno Haering, Executive Director
North Central Wisconsin Regional Planning Commission
407 Grant Street
Wausau, WI 54401
(715) 845-4208
Serves Forest, Juneau, Langlade, Lincoln, Marathon, Oneida, Portage, Vilas, and Wood Counties

Mark Mueller, Director
Northwest Wisconsin Regional Planning Commission
302 Walnut Street
Spooner, WI 54801
(715) 635-2197
Serves Ashland, Bayfield, Burnett, Douglas, Iron, Price, Rusk, Sawyer, Taylor, and Washburn Counties

Phil Blazkowski, Director
Rock County Planning Commission
51 South Main Street
Janesville, WI 53545
(608) 755-2087
Serves Rock County

Kurt W. Bauer, Executive Director
Southeastern Wisconsin Regional Planning Commission
916 North East Avenue
P.O. Box 769
Waukesha, WI 53187-1607
(414) 547-6721
Serves Kenosha, Milwaukee, Ozaukee, Racine, Walworth, Washington, and Waukesha Counties

Donald Rosenbrook, Director
Southwestern Wisconsin Regional
Planning Commission
426 Karmann Library
